HIV PERSISTENCE DURING THERAPY

Reservoirs & Eradication Strategies Workshop

Tissue resident memory programs of intestinal CD4+ and CD8+ T cells facilitate HIV-1 persistence

Yulong Wei, PhD

Conflict of interests: None

The gut accounts for 98% of the reservoir after ART

Understanding HIV persistence in the gut

CD3 enriched gut T cells

CD4s: 43,113 CD4+ cells from PLWH
6,092 CD4+ T cells from HIV- donor

CD8s: 45,475 CD8+ T cells from PLWH
6,064 CD8+ T cells from HIV- donor

Colon biopsies from:

10 people living with HIV-1 (PLWH) **under ART**

5 HIV- donor

Rectal tissue biopsies were collected by Fiber optically guided flexible sigmoidoscopy and processed into single-cell suspensions and viably frozen. Aliquots of >2.5 million cells isolated from gut biopsy were thawed. After dead cell depletion, T cells were isolated by CD3+ selection kit.

Challenge: Understanding HIV persistence is challenging because of the heterogeneity and rarity of HIV-infected cells

- CD4 iTreg
- CD4 Tfr
- CD4 TFH
- CD4 proliferating

PLWH: 54.17% TRM

HD: 61.64% TRM

43,113 CD4+ T cells from 10 PLWH, 6,092 CD4+ T cells from 5 HIV- individuals.

All dots (cells) have integrated single cell ATAC-seq, RNA-seq, and protein expression profile in the same cell

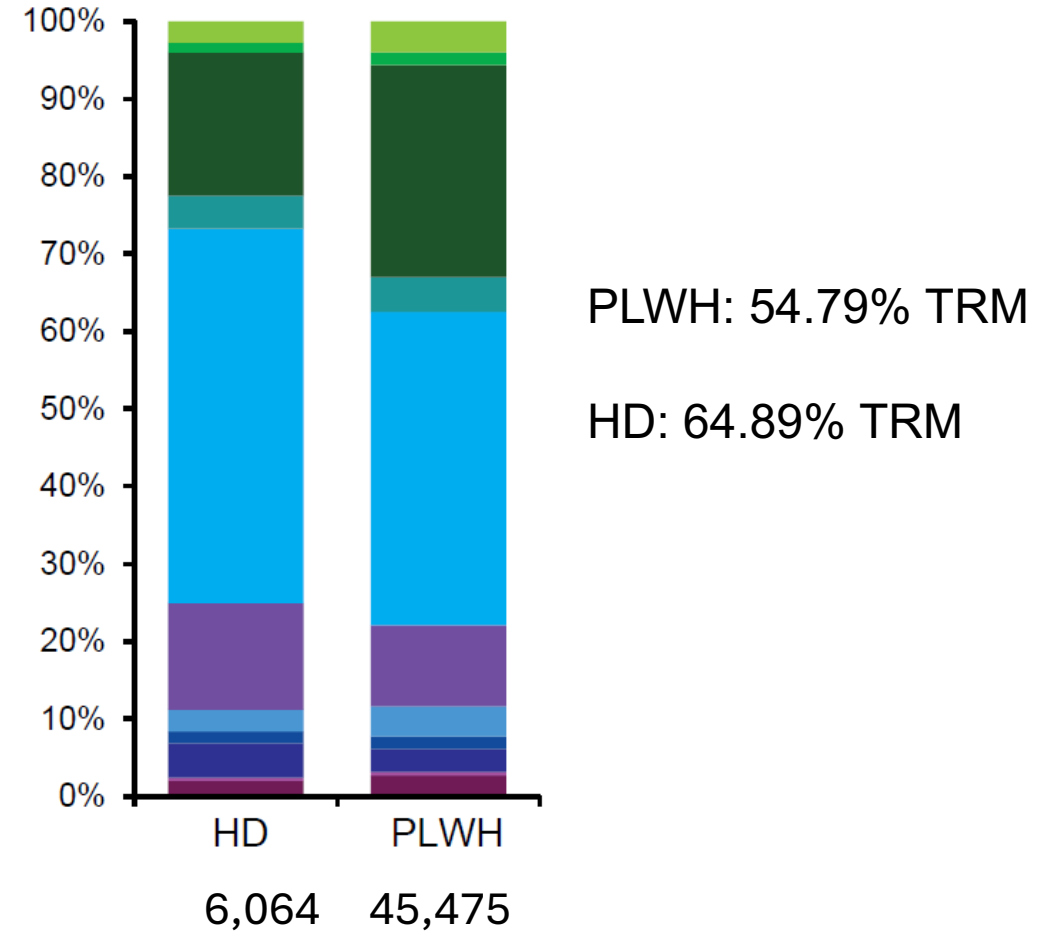

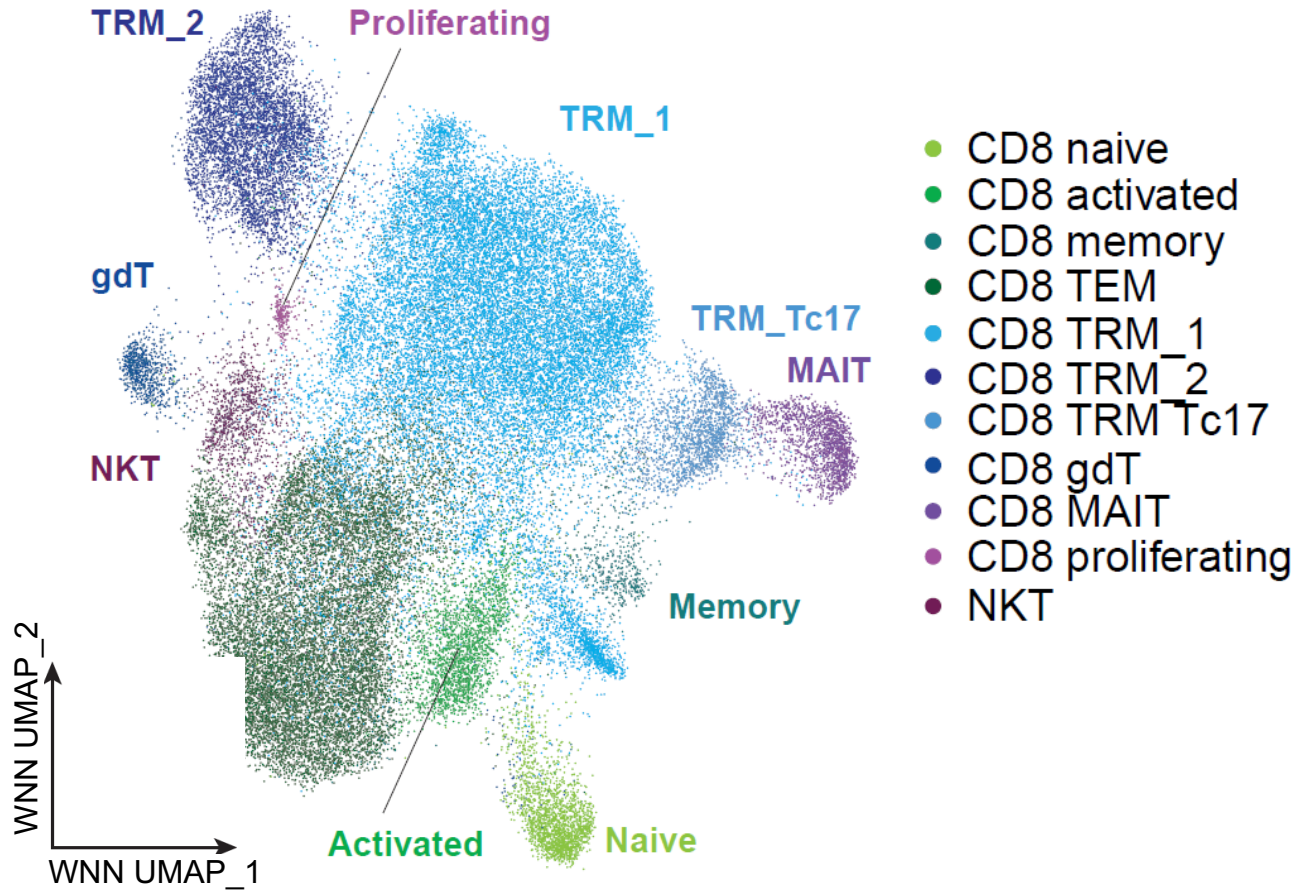

QC: remove ATACseq ≤ 200 unique ATAC fragments, nucleosome signal strength ≥ 1 , TSS enrichment score ≤ 2 , and ATAC UMI counts ≤ 350 or $\geq 20,000$

QC: remove RNAseq $\geq 25\%$ mitochondrial gene content, ≤ 200 genes, and RNA UMI counts ≤ 500 or $\geq 25,000$

Doublet removal: hashtag, SNP, scDblFinder; **Batch effect correction:** reciprocal LSI for ATAC and Harmony for RNA; **Cluster determination:** Clustree

Integration of ATAC + RNA: Weighted nearest neighbor (WNN)

Unbiased identification of immune programs dominating gut CD4s: Gene regulatory network analysis (GRN)

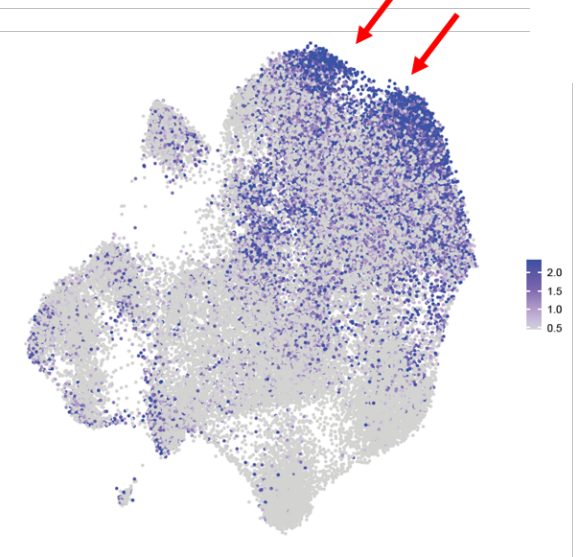

Badia-i-Mompel *et al.*, Nat Rev Genet 2023

Gene regulatory network was constructed by linking gene-TSS peak and gene-TF associations using FigR, for all domains of regulatory chromatin identified by cisTopic.

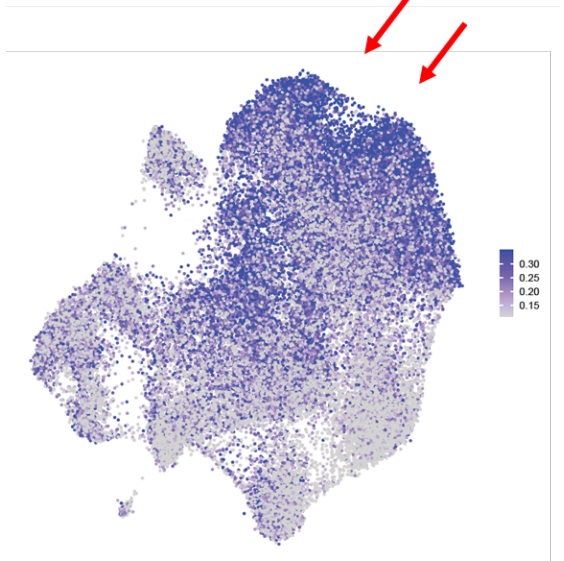

Unbiased identification of immune programs dominating gut CD4s: Gene regulatory network analysis (GRN)

BACH2 (MA1101.2)
transcription factor activity module score

Module score of genes
activated by BACH2

Example BACH2 target genes

Cytokine receptors: *IL7R*, *IL1R1*, *IL2RB*, *IL12RB2*, *IL21R*, *IL23R*, *IL4R*, *IL6R*

Chemokine receptors: *CCR7*, *CCR5*, *CXCR3*, *CXCR6*

Tissue retention: *ITGAE*, *ITGA1*, *CD69*

Unbiased identification of immune programs dominating gut CD8s: Gene regulatory network analysis (GRN)

BACH2 (MA1101.2)
transcription factor activity module score

Gene regulatory network was constructed by linking gene-TSS peak and gene-TF associations using FigR, for all domains of regulatory chromatin identified by cisTopic.

BACH2 drives long-lived memory and restrains effector function in CD8+ T cells

T cell clones and antigen specificity

Capturing T cell receptor (TCR) in DOGMA-seq identified CD4+ T cell clones in the gut

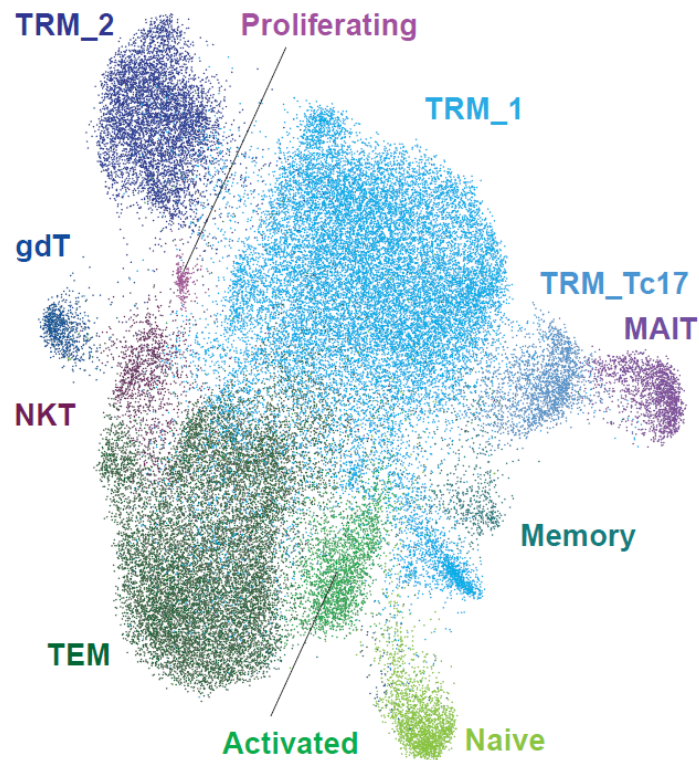

● Clones
● Not clones

13,012 TCR-captured cells from 43,113 CD4+ T cells in 10 PLWH, including 1,485 cells in clones. sequences were annotated with IgBLAST and assigned if a cell barcode is associated with ≥ 5 UMI with identical, productive, TCR β CDR3 sequences. Unique clones were determined when at-least 2 cells from the same participant shared the same productive CDR3 β junction sequence.

Capturing T cell receptor (TCR) in DOGMA-seq identified CD8+ T cell clones in the gut

● Clones
● Not clones

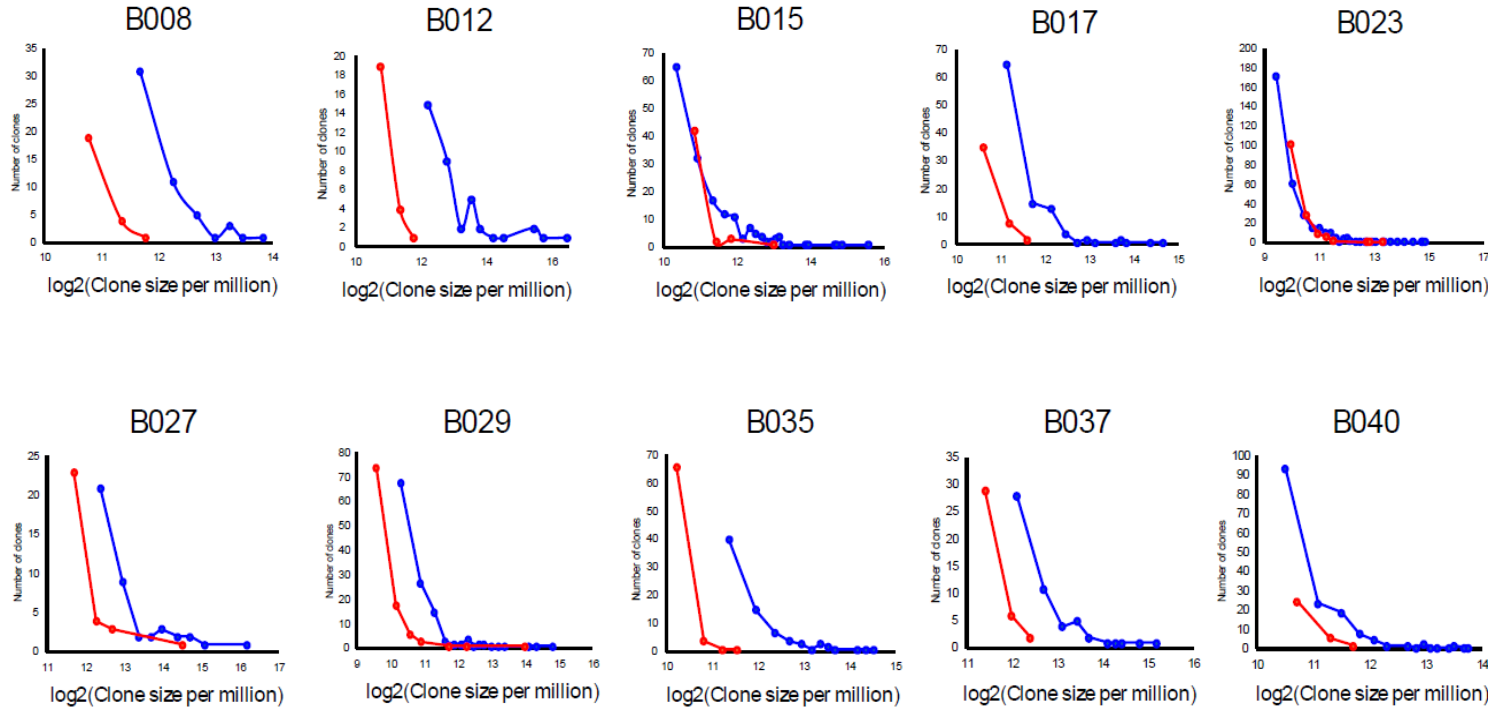

10,868 TCR-captured cells from 45,475 CD8+ T cells in 10 PLWH, including 5,510 cells in clones. TCR sequences were annotated with IgBLAST and assigned if a cell barcode is associated with ≥ 5 UMI with identical, productive, TCR β CDR3 sequences. Unique clones were determined when at-least 2 cells from the same participant shared the same productive CDR3 β junction sequence.

CD8+ T cells proliferates much better than CD4+ T cells (larger in T cell clone size)

• CD4 clones • CD8 clones

Clone size (log2 clone size/million cells)

CD4

CD8

Proportion of cells in clones

Proportion of cells in clones

Proliferation of effector CD8+ T cells is driven by interferon regulatory factors

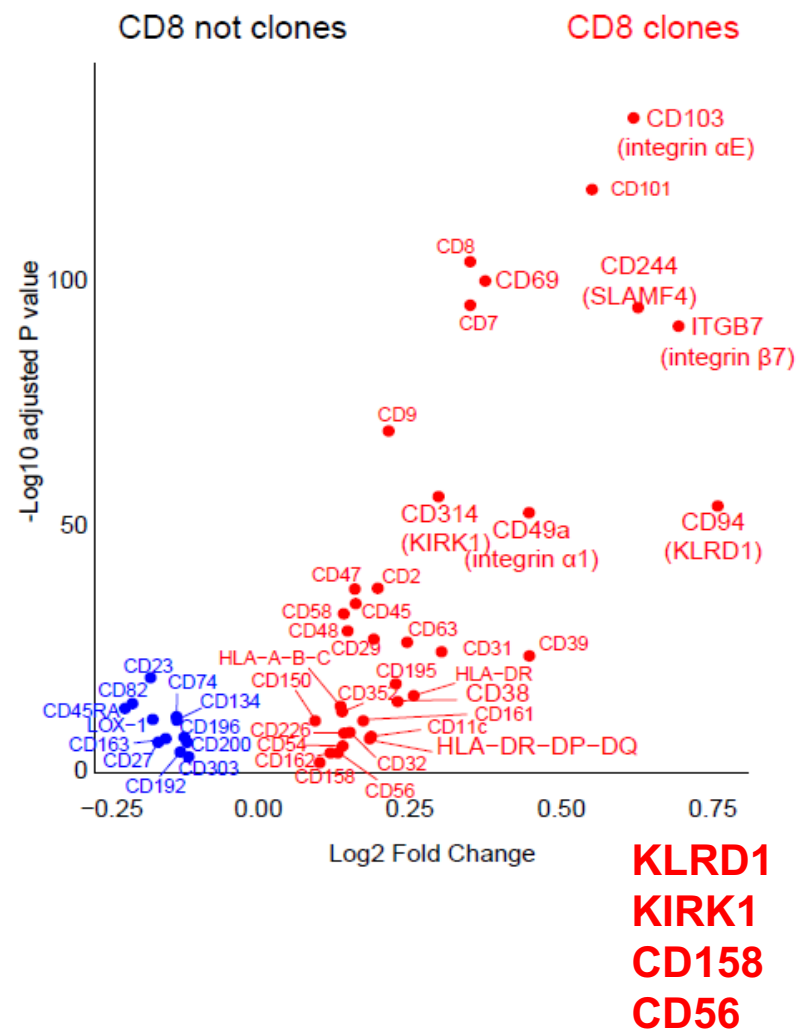

Differential transcription factor accessibility (ATAC-seq)

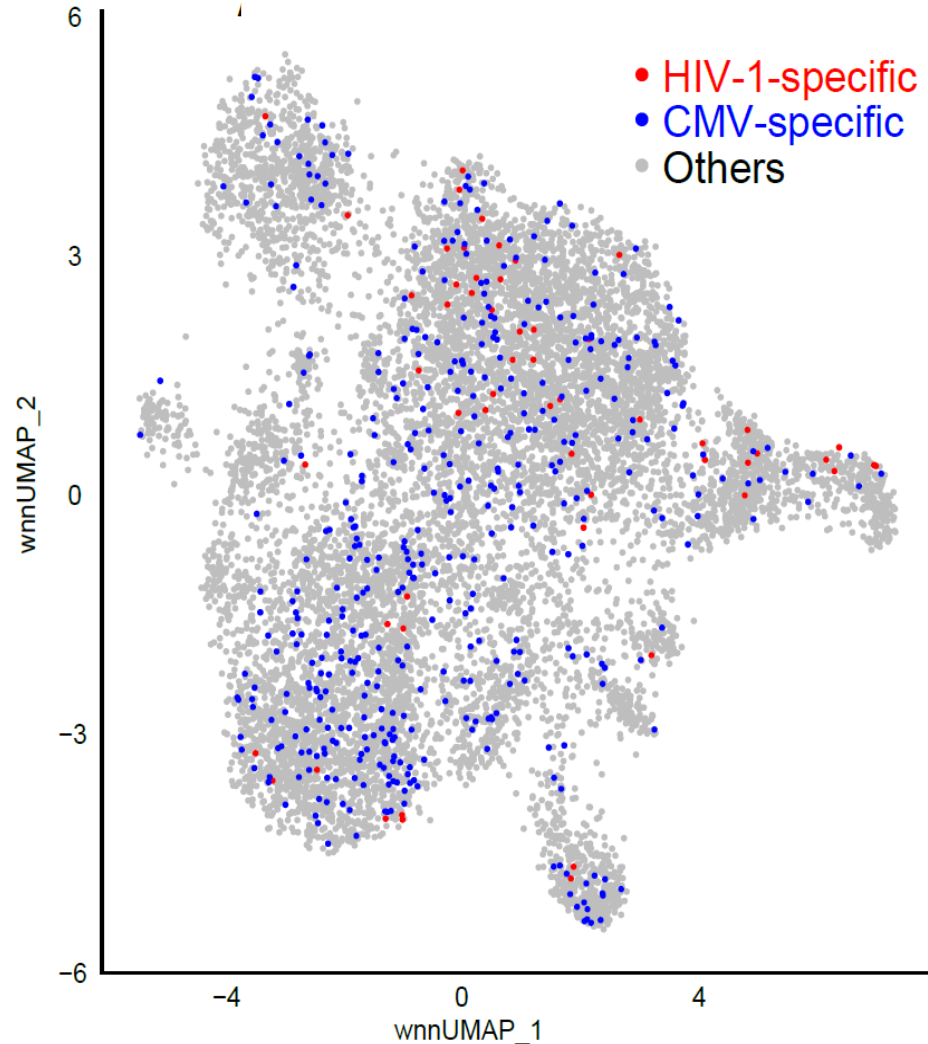

Differential gene transcription (RNA-seq)

Differential protein expression (CITE-seq)

Capturing T cell receptor (TCR) in DOGMA-seq identified HIV-1-specific and CMV-specific CD8+ T cells in the gut

10,868 TCR-mapped CD8+ T cells in PLWH, including 56 HIV-specific and 429 CMV-specific cells. 67.86% of HIV-specific CD8+ T cells are TRMs. Antigen specificity was determined by matching CDR3 β junction amino acids against McPAS-TCR database of TCRs with known antigen specificity, following criteria described in Meysman *et al.* Bioinformatics 2019.

HIV-1-specific CD8+ T cells in the gut lack effector function

BACH2 drives long-lived memory gut TRM cells

Where does HIV hide in the gut?

HIV-1-infected cells reside in gut CD4+ TRM

HIV-1 DNA

HIV-1 RNA

43,113 CD4+ T cells in 10 PLWH under ART, including 99 HIV-1+ cells.
80.81% (80/99) of HIV-1-infected cells are found in TRM.
75% (60/80) of HIV-1-infected TRM are BACH2 high cells.

HIV-1-infected cells reside in gut CD4+ TRM

43,113 CD4+ T cells in 10 PLWH under ART, including 99 HIV-1+ cells.
 80.81% (80/99) of HIV-1-infected cells are found in TRM.
 75% (60/80) of HIV-1-infected TRM are BACH2 high cells.

HIV-1-infected cells are shaped by BACH2 and exhibit TRM phenotype

Differential transcription factor accessibility

Differential RNA expression

Differential protein expression

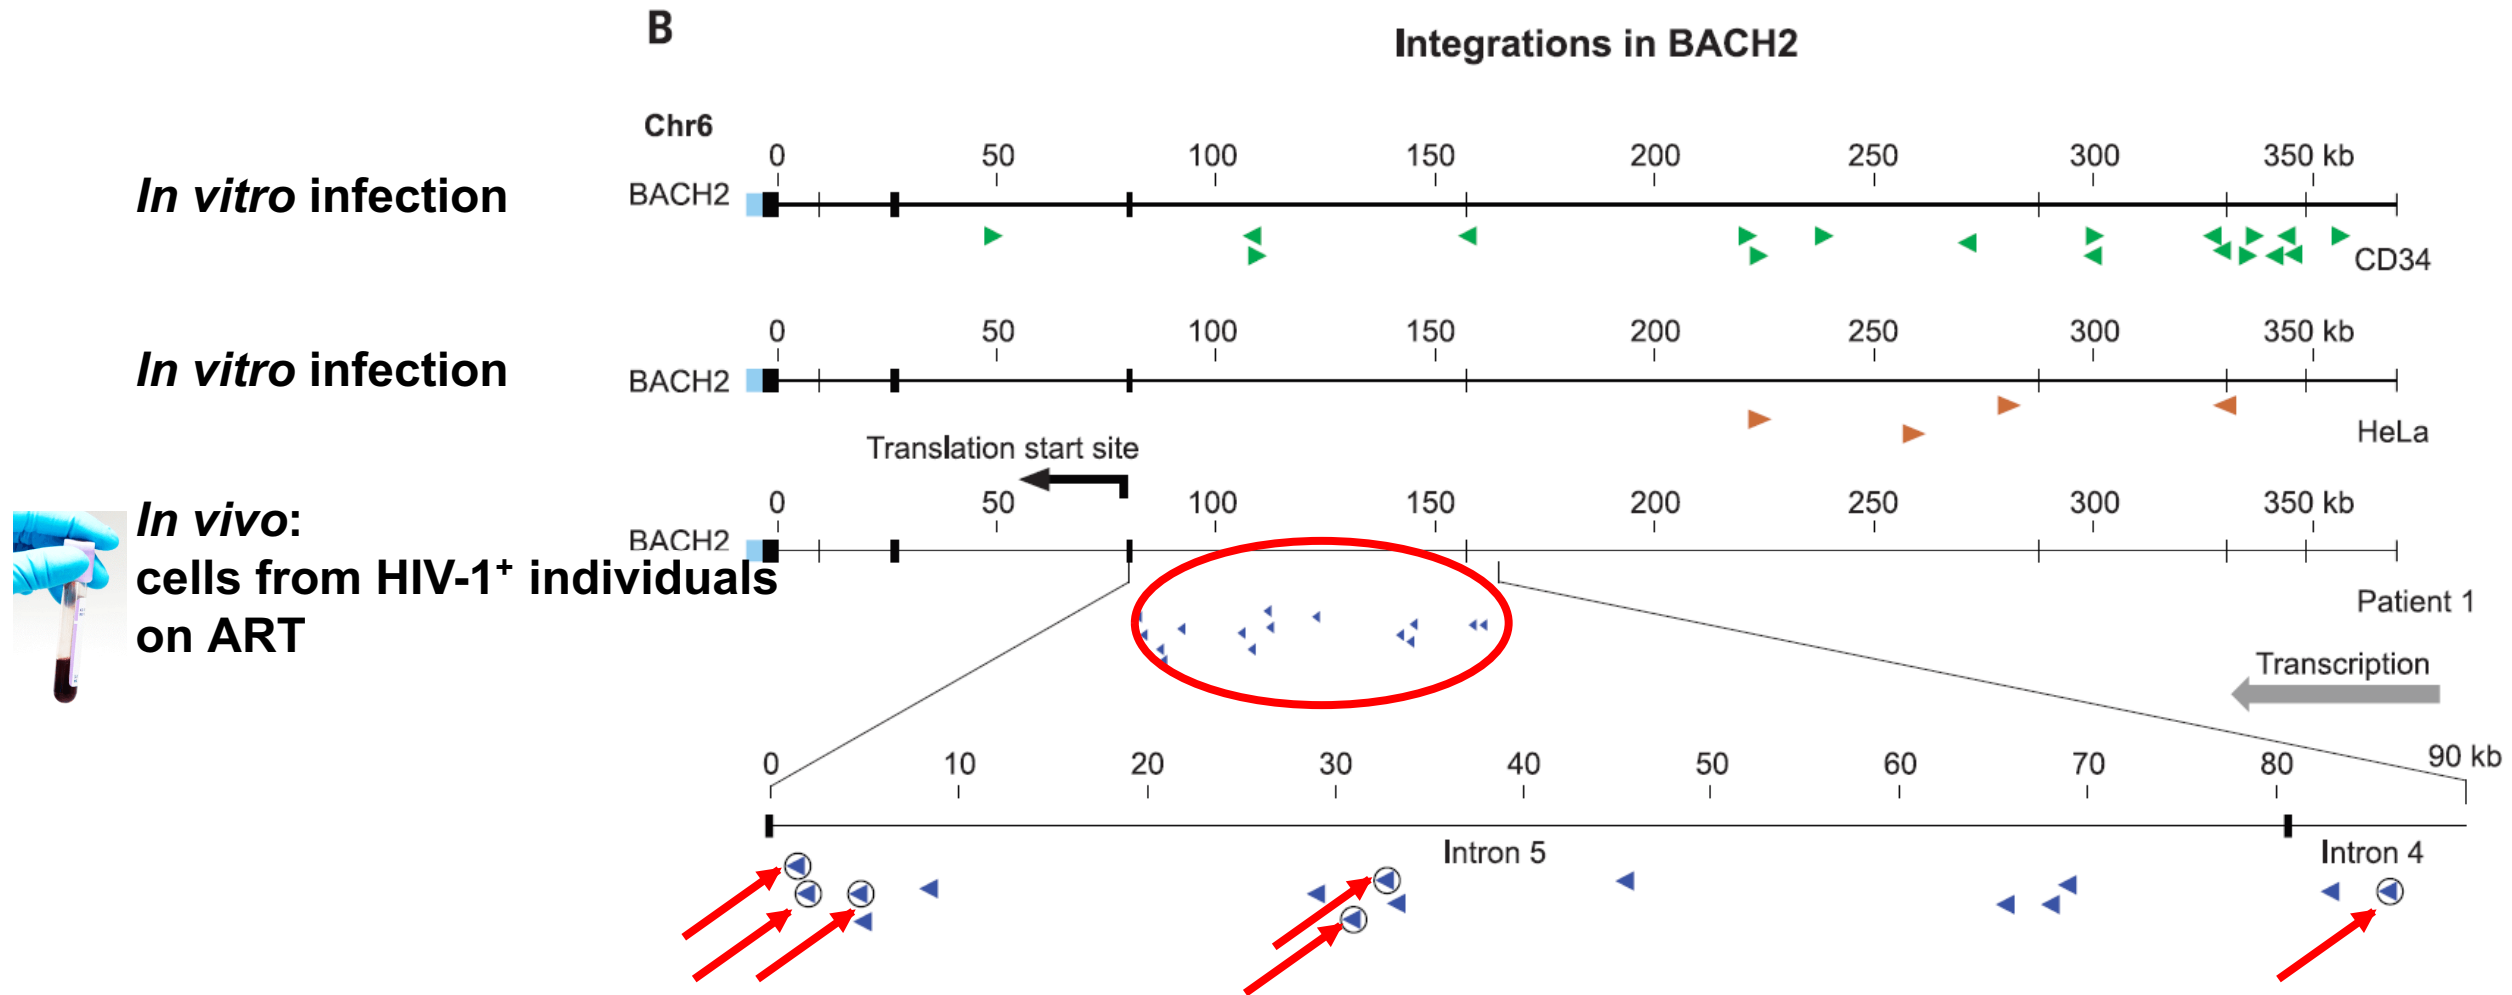

43,113 CD4⁺ T cells in 10 PLWH under ART, including 99 HIV-1⁺ cells

Transcription factor accessibility was measured by ChromVAR based on transcription factor reference motif dataset JASPER 2022

Bootstrapping: the sample size of HIV-1⁻ cells were downsized to the sample size of HIV-1⁺ cells for comparison and repeated with replacement for 1,000 times
P values were calculated by Cauchy combination test.

HIV in gut CCR6⁺CD4⁺ T cells: Waleche *et al.* Retrovirology 2016; Gosselin *et al.* AIDS 2016; Planas *et al.* JCI Insight 2017

HIV-1 integration into BACH2 drives clonal expansion of the infected cell

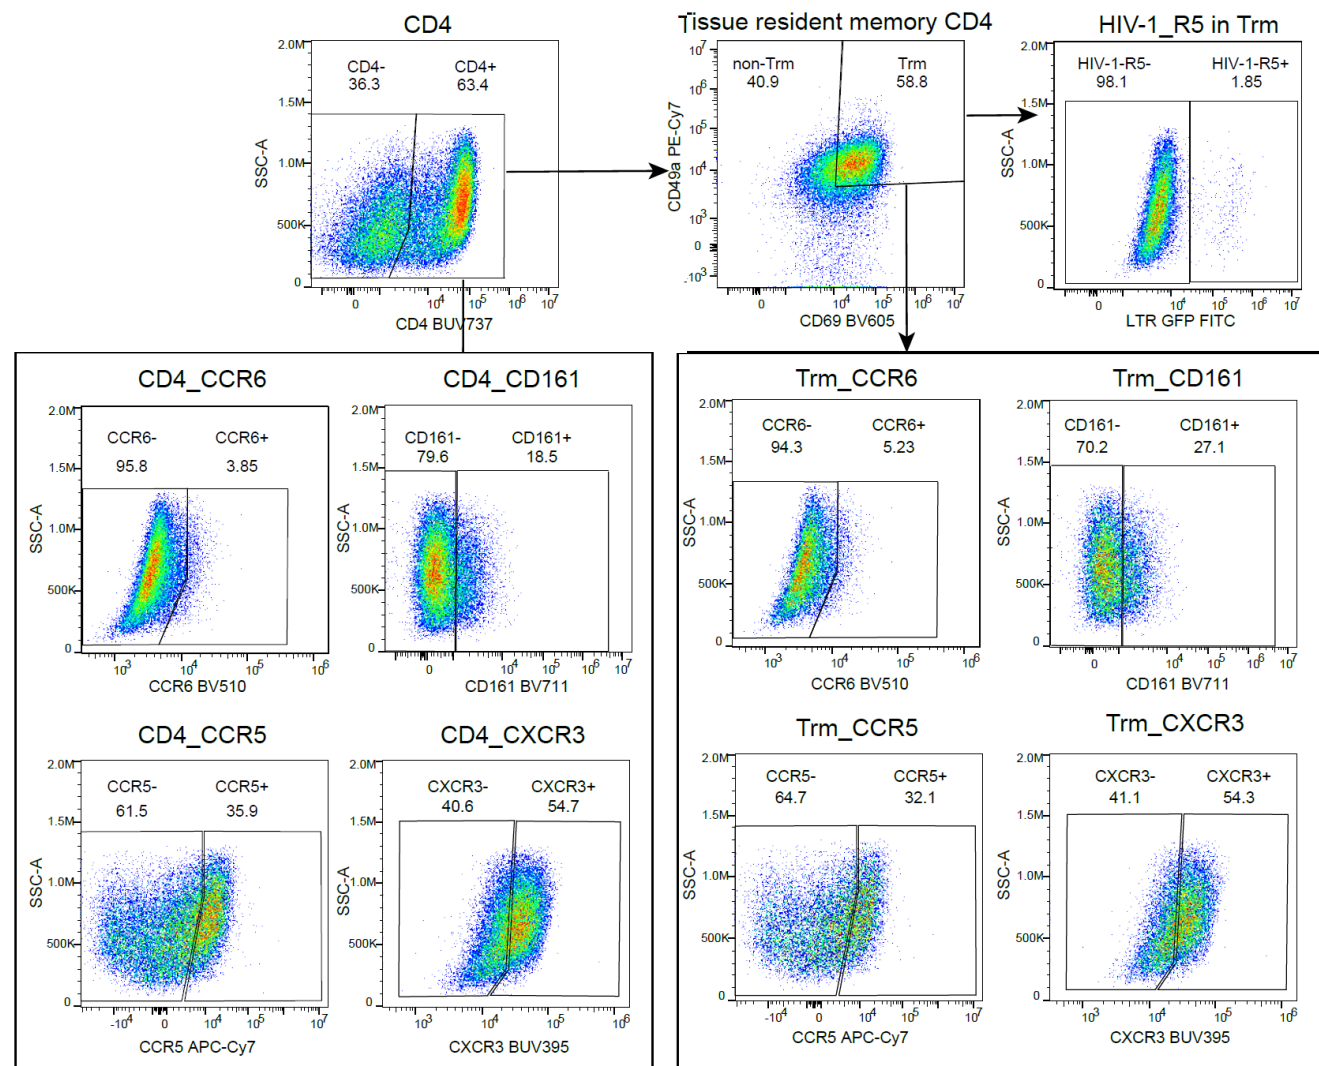

Validation: does HIV-1 preferentially infect or preferentially persist in gut TRM

Gut from HIV negative adult

Infect with HIV-1-GKO pseudotyped with JR-FL (R5 Env)

TRM: CD49a+ CD69+
Th1: CXCR3+ CCR5+
Th17: CCR6+

Katherine Ma

HIV-1 preferentially infects gut CD4+ TRM (2 days post infection) Particularly CCR6+ TRM (TRM-Th17), but not CCR5+ TRM

2 days post infection

HIV-1 preferentially **persists** in gut CD4+ TRM (7 days post infection) Particularly CCR6+ TRM (TRM-Th17), but not CCR5+ TRM

7 days post infection

BACH2 promotes tissue resident program and facilitate HIV-1 persistence

HIV-1 preferentially infects and persists in gut CCR6+CD4+ T cells

Tissue CD8+ T express Granzyme A, B, and K

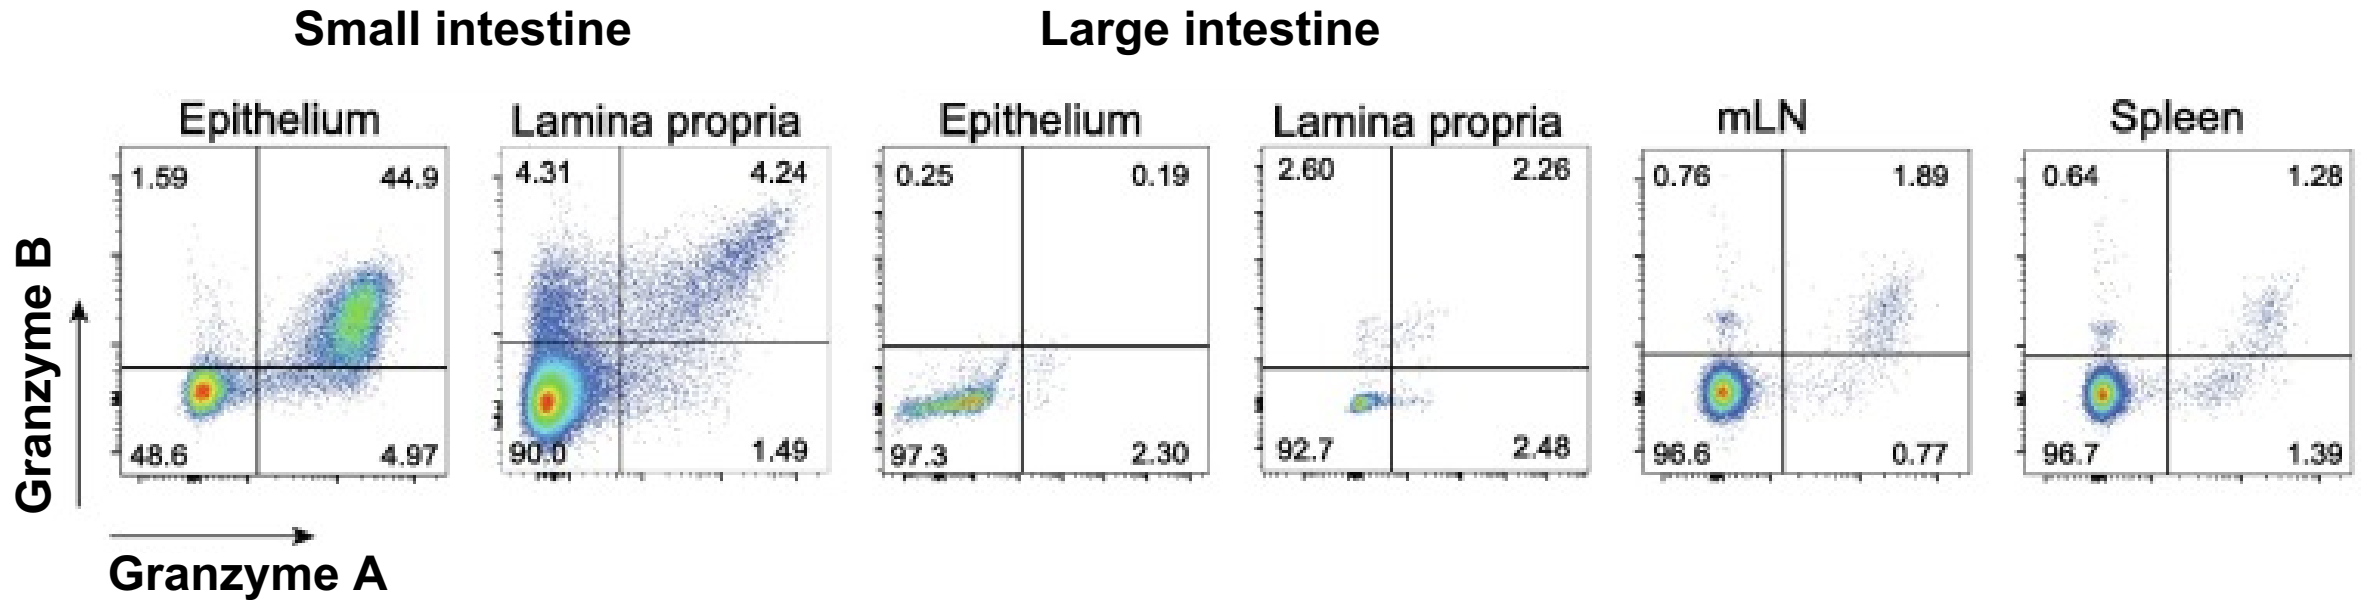

Granzyme K⁺ CD8 T cells form a core population in inflamed human tissue

cells that express GzmK alone or alongside GzmB should not automatically be labeled as memory cells or cytotoxic cells in single-cell RNA-seq data, as our findings indicate that such labels are not accurate descriptors of these human tissue-associated CD8 T cells

In the context of inflamed RA synovium, GzmK itself acted like a key inflan

GzmK induced synovial fibroblasts to activate pro-inflammatory pathways, including

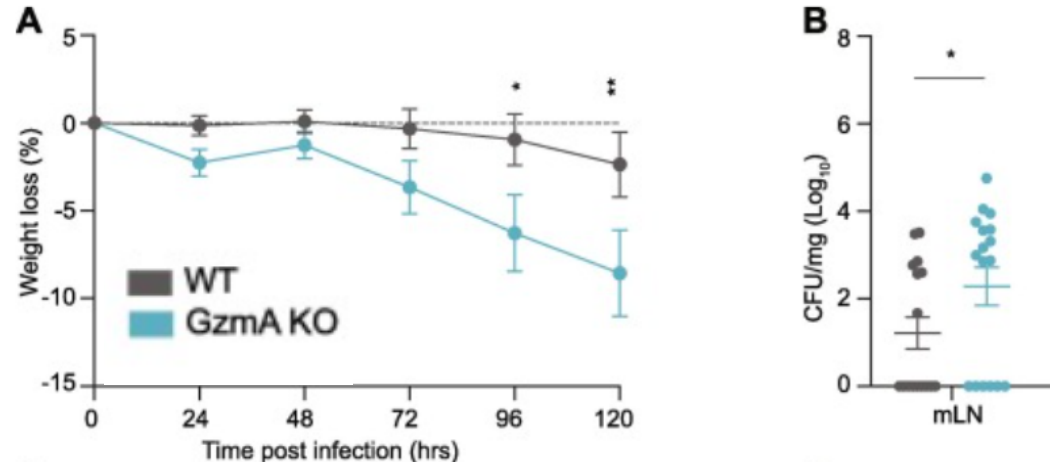

IEL Granzyme A, not granzyme B, controls *Salmonella* infection in the gut

IEL constitutively express high levels of both GzmA and GzmB, with ~20 million molecules of GzmA and ~5 million molecules of GzmB per cell.¹⁸

IEL Granzyme A, not granzyme B, controls *Salmonella* infection in the gut

Granzyme A KO mice have increased *Salmonella* growth after oral challenge

Granzyme B KO does not affect *Salmonella* growth

IEL utilize granzymes to kill infected epithelial cells independent of perforin

We next explored the mechanisms by which GzmA/B protect the intestinal epithelium. Gzms can cleave extracellular matrix proteins and epithelial cell junction proteins³⁰⁻³², and loss of this activity may affect the intestinal barrier, thus increasing bacterial translocation. However, we did not find any difference in intestinal permeability to a small molecule, FITC-Dextran, in GzmA/B dKO mice compared to WT mice

BACH2 is a transcription factor that determines T cell fate
